Unloved Stack Useful Commands

APF (Affiliate Product Finder) — local workflow reference for enrichment, Digistore24, scoring, and ShadowCast handoff. For desktop launchers and Mission Control, see **Unloved Full Stack Commands** in the same folder.

Prerequisites

```
cd ~/APF
pnpm install
cp .env.example .env   # edit DATABASE_URL, DIGISTORE24_ID, SHADOWCAST_*, etc.
pnpm db:push           # apply migrations
```

External services (must be running)

Service	Default URL	Purpose
MySQL	per DATABASE_URL	Database
ShadowCast	http://localhost:8000	Video draft handoff
SearXNG	http://localhost:8088	Review search
Ollama	http://localhost:11434	Review summarization

APF dev server default: **http://localhost:3001** (`PORT=3001` in desktop launcher; override in `.env`).

Required .env flags

```
REVIEW_ENRICHMENT_ENABLED=true
REVIEW_ENRICHMENT_PROVIDER=searxng
SEARXNG_BASE_URL=http://localhost:8088
OLLAMA_BASE_URL=http://localhost:11434
SHADOWCAST_BASE_URL=http://localhost:8000
INTERNAL_SERVICE_SECRET=change-me-local-secret
DIGISTORE24_ID=YourAffiliateNickname
```

`INTERNAL_SERVICE_SECRET` must match `~/shadowcast-/backend/.env` .

Infrastructure startup (run before APF)

```
# MySQL
docker start apf-mysql          # preferred if Docker container exists
# or: sudo systemctl start mysql

# SearXNG (APF review enrichment)
cd ~/searxng
docker compose up -d            # starts unloved-searxng on :8088
docker compose down             # stop
docker restart unloved-searxng  # restart existing container

# Ollama (enrichment + ShadowCast LLM)
ollama serve &                  # skip if already running
ollama pull qwen2.5:14b-instruct-q5_K_M   # ShadowCast default; adjust per .env
```

Health checks

```
mysqladmin ping -h 127.0.0.1 -u root   # or pnpm db:push
curl -fsS http://localhost:8088/ >/dev/null
curl -fsS http://localhost:11434/api/tags >/dev/null
curl -fsS http://localhost:8000/api/health >/dev/null
curl -fsS http://localhost:3001/api/health >/dev/null   # APF (adjust PORT if needed
```

ShadowCast (minimal — for APF handoff)

```
cd ~/shadowcast-/backend
source ../.venv/bin/activate    # or ../venv/bin/activate
source .env
python -m uvicorn app:app --host 0.0.0.0 --port 8000 --reload
# alt: python3 app.py
```

Daily startup (recommended order)

1. Start infrastructure: MySQL → SearXNG → Ollama → ShadowCast
2. `pnpm db:push` (first time or after migrations)
3. **Terminal 1 — APF + enrichment daemon:**

   ```
   cd ~/APF
   pnpm local:start
   ```

   Starts review enrichment daemon (if enabled) and dev server (default `:3001`).

4. **Terminal 2 — Digistore24 browser collector:** `pnpm digistore24:daemon`
5. **First login or expired session:** `pnpm digistore24:login`
6. **In the UI:** Digistore24 → Refresh Data
7. `pnpm review:status` until `complete`, then ShadowCast handoff

Enrichment commands

Command	Purpose
`pnpm review:daemon:start`	Start enrichment daemon manually
`pnpm review:daemon:logs`	Tail enrichment logs
`pnpm review:worker`	Run worker loop continuously
`pnpm review:once`	Process one job and exit
`pnpm review:status`	Queue status + products not yet complete
`pnpm review:requeue-digistore24`	Re-queue all Digistore24 + seed vendor materials

Typical enrichment flow

1. Products queue automatically on collection.
2. Daemon/worker processes jobs (SearXNG + Ollama).
3. Check progress: `pnpm review:status`
4. Force Digistore refresh after schema changes:

```
pnpm review:requeue-digistore24
pnpm review:once    # repeat until complete
```

5. Wait for `enrichment_status = complete` before ShadowCast handoff.

Digistore24 health & diagnostics

```
pnpm digistore24:session:check
pnpm digistore24:daemon:health
pnpm digistore24:daemon:open      # ensure daemon + open browser
pnpm digistore24:daemon:collect   # trigger collect
pnpm digistore24:daemon:stop
```

Optional API/import tools (not main refresh path)

```
pnpm digistore24:test-api
pnpm digistore24:import-api
pnpm digistore24:discover
pnpm digistore24:import-all
```

Scoring

```
pnpm score:explain              # dry-run, 25 products
pnpm score:backfill             # all marketplaces
pnpm score:digistore24          # Digistore only
pnpm score:digistore24:explain  # dry-run Digistore
```

ShadowCast handoff

After enrichment is `complete`:

- **UI:** Product detail → Send to ShadowCast
- **CLI:**

```
pnpm local:smoke-test       # end-to-end check
pnpm shadowcast:send        # direct send
pnpm export:shadowcast      # export enriched JSON
pnpm shadowcast:export-ui   # local picker UI
```

Other useful commands

```
pnpm dev                 # APF only (no enrichment daemon)
pnpm build && pnpm start # production
pnpm check               # TypeScript
pnpm test                # vitest
```

Minimal checklist

1. Start MySQL, SearXNG, Ollama, ShadowCast (see Infrastructure startup)
2. `pnpm db:push`
3. `pnpm local:start`
4. `pnpm digistore24:daemon` (+ login if needed)
5. Refresh Digistore24 in UI

6. `pnpm review:status` until `complete`
7. `pnpm local:smoke-test` or Send to ShadowCast in UI
